

Project 4: Web Security
Magahet Mendiola

Target 1: XSRF

The vulnerable code is in `account.php:24`
because it displays the expected response, which can be used in the form submission.

Target 2: XSS-password theft

The vulnerable code is in `index.php:29`
because it sends unvalidated user input back to the client browser, which can be used to inject malicious code.

Target 3: SQL Injection

The vulnerable code is in `auth.php:52`
because it uses the non-escaped form of the username in the SQL query, which can be used to comment out the password checking component of the query.
